

LATERALLY ADJUSTABLE, LOW PROFILE TRENCH-DIGGING MACHINE

ABSTRACT OF THE DISCLOSURE

A trench digging machine is provided that includes a digging implement capable
5 of being laterally offset beyond the bounds of the transport machine, thereby enabling the
trench digging machine to dig trenches that are laterally offset from the transport
machine. The trench digging machine also generally includes an attachment plate and
frame to operably connect the digging implement to the transport machine. The
attachment plate may be disposed at an angle offset from vertical such that the attachment
10 plate faces downwardly. As such, the frame and, in turn, the digging implement may be
operably connected to the transport machine at a position closer to the ground, thereby
reducing the clearance required for access by the digging implement.
